CONTROL/AI

# How to Help

Our plan to address the extinction risks posed by the development of superintelligence is:

1. **Design policies** that target ASI development and precursor technologies
2. Then, **convince policymakers** in key jurisdictions around the world to implement these policies.

For Step 1, we have written a policy memo on the policies needed to achieve this, and discussed the measures in more detail in A Narrow Path.

What remains is scaling up the civic engagement necessary for the success of step 2: to promote and implement these policies in as many countries as possible. As demonstrated by our proof-of-concept campaign in the UK, directly contacting elected representatives works, and it is possible to push forward the risks from superintelligence and proposed policies.

# Our Recommendations

We have tailored policy recommendations for key jurisdictions, as well as policy recommendations for the rest of the world. Recommend these policies when reaching out to policy makers in your jurisdiction. You can download country-specific policy briefings below: click on the button of your country.

If you find more than 5 officials interested in our policies and draft bills in your jurisdiction, let us know and we might add your jurisdiction here.

## State Of AI Regulation

The US has not passed any legislation enforcing regulation of the most powerful AI systems.

The Trump Administration has revoked the Biden Administration's primary Executive Order on AI, and has announced the "commitment of the United States to sustain and enhance America's dominance in AI to promote human flourishing, economic competitiveness, and national security." The Trump Administration, as of this writing, is in the process of developing an AI Action Plan, due 180 days from 23 January 2025; as of now, its content is uncertain.

The United States, however, continues to run its US AI Safety Institute, focused on assessing the risks of the most powerful frontier AI models.

## Policy Brief

Here is our US policy brief:

# Concrete Actions

## Organizations

If you are an organization, you can participate in this civic engagement by doing what we did in your jurisdiction:

1. Identify the public officials most relevant to AI policy and regulation in the US
   a. On the legislative side, the contact details of elected officials in the US, Congressmen and Senators, are often available here. You can contact them directly.
   b. On the executive side, the department that currently mainly owns AI policy and regulation is the National Institute of Standards and Technology (NIST), as part of the Department of Commerce. Public-facing contact information for some civil servants and other non-elected officials in this department may not be easy to find.
2. Contact the relevant public officials, and for those that are not publicly reachable, leverage your network to reach out and meet them
3. Make the case about AI risk and the need for targeted regulation
4. Offer the US policy brief above as a set of concrete policies they can promote and implement

Once you have contacted more than 5 public officials, you can let us know by reaching out to hello@controlai.com. We will be happy to schedule a call and provide advice and ideas.

Also, if the public officials you are engaging with are interested in making the policy proposals happen, you can put us in touch with them at hello@controlai.com to discuss next steps and concrete legislation proposals.

## Individuals

If you're an individual citizen, the main action you can take is using our automated form to contact your Senators.

You can also look at our resources for supporters for more actions you can take.

If you find yourself overextended or out of your depth with regard to this plan, the arguments for AI risks, or the policy proposals, feel free to contact us at hello@controlai.com.

---

# Overview Of The US Policy Process

The legislative branch in the US is composed of two houses

- The House of Representatives
- The Senate

The executive branch is headed by the President (often referenced by his residence, "the White House"), and the executive departments and agencies generally report to the President.

- The heads of all executive departments and most agencies are nominated by the President and confirmed by the Senate. (Some lesser offices and most staff roles are nominated by the President, but do not require Senate confirmation.)
  - Note that some regulatory agencies are quasi-independent, though their constitutional status is complex.
- The executive branch holds, broadly speaking, national security, regulatory, administrative, trade/commerce, and other domestic federal powers

Any bill must pass through both houses, and either a) receive the President's signature or b) if the President vetoes the bill by refusing to sign it, a 2/3rds vote of both houses to override the veto, to become law
